Question 1:
Write a python program to accept only two words from the user and display error like message using print() if the user disobeys.

Program:
```
str = input("Enter only two words: ")
print(str) if(len(str.split()) == 2) else print("Error")
```

Output:
```
Enter only two words: I Think
I Think

Enter only two words: I Think Therefore
Error
```

Question 2:
Write a python program to accept multiple words and display them.

Program:
```
str = input("Enter multiple string with space delimiter: ")
for n in range(len(str.split())): print("Word {} is {}".format(n+1, str.split()[n]))
```

Output:
```
Enter multiple string with space delimiter: Complex is better than complicated.
Word 1 is Complex
Word 2 is is
Word 3 is better
Word 4 is than
Word 5 is complicated.
```

Question 3:
Consider the following python code
$a = 2.0$
$b = 1.832$
$c = a - b$

output of c variable:
0.16799999999999993

rectify it:

Program:
```
a = 2.0; b = 1.832; c = a-b
print(round(c,3))
```

Output:
```
0.168
```
